

FAIRFIELD TOWNSHIP

ANNUAL WATER QUALITY REPORT 2019

Fairfield Township is committed to producing the best quality drinking water possible. The purpose of this report is to provide you with information about your drinking water. The report explains to you where your water comes from and the treatment it receives before it reaches your tap. This report also lists contaminants detected in your water and an explanation of violations in the past year.

WHERE ARE YOUR WATER SOURCES LOCATED?

The source of your drinking water comes from two wells located in Madison Township and is supplied by Madison Township. Both have a 10-inch diameter casing with total, combined pumping capabilities of 1,425 gallons per minute.

The State of Michigan Primacy Agency recently performed an assessment of your source water to determine the susceptibility to or the relative potential of contamination. The susceptibility rating is on a seven-tiered scale from “very-low” to “very high” based primarily on geologic sensitivity, water chemistry and contaminant sources. The susceptibility of your source water is termed “moderately low” (tier 3 of 7). More information from this report is available by contacting the Madison Township Department of Public Works.

Water from each of the wells is pumped to the Iron Removal Facility where sodium permanganate and sodium hypochlorite are added to aid in the iron removal process and to provide a disinfectant in the water distribution system.

From here, the water passes through an iron removal process to reduce staining of clothes and fixtures in the distribution system. Treated water is then pumped to the distribution system and elevated storage tank, which maintains constant pressure in the distribution system. The elevated storage tank has a total storage capacity of 150,000 gallons. Our normal system pumpage ranges from 120,000 gallons to 140,000 gallons depending on demand (i.e. weather and fire flow).

Fairfield Township has a complex network of water mains that provide transmission and distribution throughout the service area. The existing Township water system serves approximately 1.5 square miles and has a distribution network consisting of more than 8.5 miles of water main.

The State of Michigan Department of Environment, Great Lakes, and Energy (EGLE) monitors public water supplies very closely. One method is to require samples to be collected monthly and testing for bacteria. One sample is collected each month and submitted to the DEQ with a monthly operation report.

Drinking water, including bottled water may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about the contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotlines at: (800) 426-4791.

GROUNDWATER: OUR WATER RESOURCE

Fairfield Township's water supply comes from groundwater. As water travels through the ground, it dissolves naturally occurring minerals and can pick up substances resulting from the presence of animals or from human activity. These include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, livestock and wildlife.
- Inorganic contaminants, such as salts and metals, which can occur naturally or may result from storm water run-off, wastewater discharges, oil and gas production and farming.
- Pesticide and herbicides, which may come from a variety of sources such as agriculture, urban storm water run-off and residential uses.
- Organic chemicals, including synthetic and volatile organic chemicals, which are by-products of industrial process and petroleum production, and can, also originate from gas stations, storm water run-off and septic systems.
- Radioactive substances, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe, the U.S. Environmental Protection Agency (EPA) prescribes regulations, which limit the amount of certain contaminants in drinking water provided by public water systems.

If you would like more information about your drinking water, please call Tim Watterson at the Charter Township of Madison (517) 263-9313.

Some People may be more vulnerable to contaminants in drinking water than the general populations. Immuno-Compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/Aids or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of the infection by *Cryptosporidium* and other microbial contaminants are available from the **Safe Drinking Water Hotline (800) 426-4791**.

YOUR WATER QUALITY DATA

Each year, Fairfield Township is required to sample the drinking water for various contaminants. The table below lists contaminants that were detected in 2019. The state allows us to monitor for certain contaminants less than annually because the concentrations of these contaminants are not expected to change frequently. The most recent results of these tests are also included in the table.

Terms and Abbreviations:

- **Maximum Contaminant Level (MCL):** The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as possible using the best available treatment technology.
 - **Maximum Contaminant Level Goal (MCLG):** The level of a contaminant in drinking water below which, there is no known or expected health risk.
 - **Maximum Residual Disinfectant Level Goal (MRDLG):** The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
 - **Maximum Residual Disinfectant Level (MRDL):** The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
 - **Action Level (AL):** The concentration of a contaminant which, when exceeded, triggers treatment or other requirements which a water system must follow.
-
- **Ppm** – parts per million
 - **Ppb** – Parts per billion
 - **ND** – Not Detectable
 - **N/A** – Not applicable

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Fairfield Township is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using your water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 Or <http://www.epa.gov/safewater/lead>.

Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of time could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years could suffer liver or kidney damage. People with Wilson's disease should consult their personal doctor.
